

French new energy base station work

Drawing such a large percentage of overall electrical production from nuclear power is unique to France. This reliance has resulted in certain necessary deviations from the standard design and function of other nuclear power programs. For instance, in order to meet changing demand throughout the day, some plants must work as peaking power, whereas most nuclear plants in France's energy sector recently marked a significant milestone with the successful start-up of the Flamanville 3 nuclear reactor. After 12 years of delays and challenges, the reactor finally began generating power on December 20, 2022, according to Électricité de France (EDF). France's energy sector recently marked a significant milestone with the successful start-up of the Flamanville 3 nuclear reactor. After 12 years of delays and challenges, the reactor finally began generating power on December 20, 2022, according to Électricité de France (EDF). With historic progress in 2022, promises to be a decisive year for French nuclear energy. Between new energy strategies, major reforms, and public debates, the challenges are immense. Here's an overview of the five key developments to watch closely as the sector undergoes significant changes.

Electricity production in France has been dominated by nuclear power since the early 1980s with a large portion of that power exported today. Since the mid-1980s, the largest source of electricity in France has been nuclear power, with a generation of 379.5 TWh in 2022 and a total electricity production of 510.5 TWh. France derives about 70% of its electricity from nuclear energy, due to a long-standing policy based on energy security. Government policy, set under a former administration in 2017, aimed to reduce nuclear's share of electricity generation to 50% by 2035. This target was delayed in 2022. President Emmanuel Macron's ambitious plan to revive France's nuclear energy industry aims for carbon neutrality by 2050. It highlights significant challenges, including climate risks to nuclear sites, such as the Gravelines plant, which faces flooding threats due to rising sea levels. A strategic contract has been signed between the major French industrial players, the government and trade unions aimed at coordinating the country's nuclear industry for the planned life extension of current reactors and the construction of new ones. The signing of the contract (Image: EDF) In 2022, EDF says grid connection of 1,630-MW reactor scheduled for end of autumn. The Flamanville nuclear power station in northern France, where Unit 3 is starting up. Courtesy EDF. France is starting up the long-delayed Flamanville-3 EPR nuclear power plant in France with teams starting work on the site. France 'far from ready' to build six new nuclear reactors. French President Emmanuel Macron announced a plan in 2022 for state-owned utility EDF to build six European pressurised reactors (EPRs). Nuclear in France: The Five Major Challenges for 2022. Between new energy strategies, major reforms, and public debates, the challenges are immense. Here's an overview of the five key developments to watch closely as the sector undergoes significant changes.
